

# PHASE 2 — REQUIREMENT ANALYSIS

Script-Controlled ACL – Restrict Record Access Based on Field Value

Project Phase: Requirement Analysis | Platform: ServiceNow | Project Area: Access Control

## Functional Requirements

The requirements are derived directly from the supplied Script-Controlled ACL lab.

- Create the EEE User test account.
- Create roles bb1, bb2, bb3 and bb4.
- Create u\_institution\_details as a custom table.
- Add the documented student and contact fields.
- Use ECE, EEE and CSE as Branch choices.
- Create READ, CREATE, WRITE and DELETE ACLs.
- Use impersonation to verify access.

| Area           | Requirement                    |
|----------------|--------------------------------|
| User           | EEE User                       |
| Roles          | bb1 / bb2 / bb3 / bb4          |
| Table          | u_institution_details          |
| Branch         | ECE / EEE / CSE                |
| ACL operations | Read / Create / Write / Delete |

## Data Requirements

The table structure is important because the Branch field is used in the documented READ scenario.

| Field               | Type / Setting        |
|---------------------|-----------------------|
| Student Roll Number | Auto Number           |
| Student Name        | Reference – User      |
| Faculty Name        | Reference – User      |
| Branch              | Choice: ECE, EEE, CSE |
| Email               | String                |
| Phone Number        | String                |
| Description         | Multi String          |

### Requirement Relationship

## Security Requirements

| Operation | Required Role | Documented Rule                  |
|-----------|---------------|----------------------------------|
| READ      | bb1           | Branch is EEE; script-controlled |
| CREATE    | bb2           | No data condition                |
| WRITE     | bb3           | No data condition                |
| DELETE    | bb4           | No data condition                |
| Admin     | admin         | Full access in READ script       |

Acceptance must follow the verification statements in the supplied lab: bb1 can view EEE records, a user without the role cannot view records, and Admin can view all records.
