

PHASE 6 — PROJECT TESTING

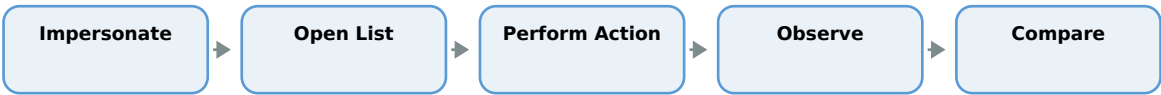

Script-Controlled ACL – Restrict Record Access Based on Field Value

Project Phase: Project Testing | Platform: ServiceNow | Project Area: Access Control

Testing Strategy

Testing uses impersonation and the Student Records list, following the verification steps in the supplied lab.

Testing Flow

Test	User	Expected Result
TC-01	bb1 user	EEE records visible
TC-02	No required role	Records not visible
TC-03	Admin	All branch records visible

Operation Testing

ID	Roles	Operation	Expected
TC-04	bb1 + bb2	Create	Create allowed
TC-05	bb1 + bb2 + bb3	Write	Edit allowed
TC-06	bb1 + bb2 + bb3 + bb4	Delete	Delete allowed

These expected results follow the cumulative verification statements in the supplied project document.

Defect Checks

Observed Problem	Check
Wrong branch visible	READ ACL, EEE condition and script
Intended user blocked	Role assignment and ACL active state
Create unavailable	bb2 CREATE ACL
Edit unavailable	bb3 WRITE ACL
Delete unavailable	bb4 DELETE ACL
Admin blocked	Admin logic in READ script

Testing is complete when the observed behavior matches the documented verification results.
